ATLANTA 22. GEORGIA

Vol. 11, No. 4

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED JANUARY 27, 1962

INFLUENZA - Epidemics of respiratory disease attended by increased school absenteeism are currently prevalent throughout the Midwestern and Southeastern States. Following the first Midwestern identification in Missouri and Southern Illinois, epidemic Influenza B spread to involve Eastern Kansas, Western Kentucky, Central Tennessee, and North Georgia. This week, in addition to further spread within these States, a marked increase in reported outbreaks has occurred in the neighboring States of Ohio, North Carolina, Arkansas, Minnesota, Wisconsin, Iowa, North Dakota, and Nebraska. On the periphery of this epidemic activity, scattered outbreaks were noted in South Carolina, Alabama, Indiana, Wisconsin, Oklahoma, and Texas.

Scattered outbreaks of acute febrile respiratory disease were noted in the Northeastern United States. Increased school absorbers m and/or respiratory disease outbreaks were observed in Southern Maryland (three counties) New Jersey (eight counties), Pennsylvania (two counties), Connecticut Itwo counties), Massachuset two counties 262ermon wo counties), and New York (two counties).

the epidemic has waped in the Pacific Coast States and is evidencing little spread in the Rocky Mountain

Influenza B has now been confirmed by virologic isolation or serologic titer rises in outbreaks in 18 States and the District of Columbia, Additional States reporting

confirmations this week include Ohio, Minnesota, North Carolina, Wisconsin, Kansas, Iowa, and Utah. No evidence of Influenza A activity has yet been uncovered.

Deaths from pneumonia and influenza in 108 United States cities remain elevated above expected levels for the fourth consecutive week (see accompanying graph, page 27). Excess mortality this week is recorded in three of the nine geographic divisions of the country.

Epidemics of respiratory disease confirmed as Influenza B are occurring in Poland, Spain, Denmark, and the United Kingdom.

HEPATITIS – A total of 1,508 cases was reported for the 4th week ending January 27, a decrease of 72 cases over the number reported in the preceding week. For the corresponding 4th week of 1961, 1,851 cases of hepatitis were reported. The interruption in the continuous rise in hepatitis cases at this early date in 1962 would suggest that the number of hepatitis cases in 1962 will be lower than the total of 72,000 reached in 1961.

POLIOMYELITIS - Three cases of polio, 2 paralytic, were reported for the week ending January 27. This equals the record low of 3 cases, 3 paralytic, which were reported for the week ending February 25, 1961.

EPIDEMIOLOGICAL REPORTS

Clostridium Food Poisoning - Connecticut, 1961

Three outbreaks of *Clostridium perfringens* food poisoning occurred in Connecticut during the year 1961. The last occurred on December 5, 1961, and is described below.

Approximately half of 68 people who had dined at a restaurant developed mild diarrhea and abdominal pain of a few hours duration within eight to 14 hours after eating. In a few cases, nausea occurred but there was no vomiting. Of the 68 individuals, 38 ate roast beef, 18 ate broiled lobster, 9 ate turkey, and 3 ate picked-out lobster. Of the 26 with illness, 21 had eaten roast beef, four had eaten turkey, and one had eaten lobster.

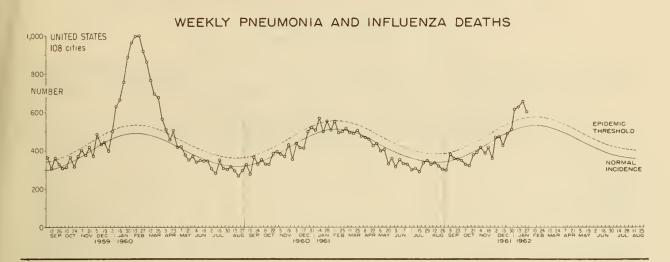

Five roasts of beef, boned by the wholesale meat distributor, and averaging about 18 lbs. in weight, were used for this meal. These were cooked for about 3 hours in a 350° oven, coming out of the oven at about 4:15 P.M. Some were then kept on the steam table and some beside the steam table until used at 7:30 P.M. Gravy was au jus gravy made at about 5:30 P.M. from the drippings of the roasts, a commercial beef base and seasonings. Drippings from the roasts were also used to moisten some of the turkey when it was removed from the refrigerator and warmed for use.

Samples of turkey, roast beef, and gravy were available for laboratory examination. No food poisoning organisms were found in the samples of turkey or roast beef examined. Clostridium per/ringens was isolated from the gravy. Samples of the commercial beef base used in the gravy were negative. Nose and throat cultures of the meat cooks were negative.

The laboratory of the Connecticut State Department of Health routinely does anaerobic cultures on all samples of food examined in relation to food-borne outbreaks, except when epidemiological evidence strongly suggests that the outbreak is staphylococcal.

Two other outbreaks apparently due to Clostridium per/ringens were identified in Connecticut in 1961, through this routine use of anaerobic cultures. One of these oc-

(Continued on page 32)

SUMMARY OF DEATHS AMONG PERSONS 65 YEARS AND OVER IN 108 UNITED STATES CITIES

The chart below shows the average weekly number of deaths among persons 65 years and over by four-week periods. As in previous MMWR charts in this series, the "expected number" of deaths was computed by use of a Fourier Series with a linear trend component. One Fourier term was used in this chart.

For the four-week period ending January 27th excess mortality (see table below) in persons 65 years of age and older averaged 395 deaths per week, about five percent above expected levels. The total number of deaths in elderly persons during this period of the current Influenza B epidemic was at about the same level as in the corresponding period (see chart)

of the 1960 Influenza A_2 epidemic. However, excess mortality has been considerably less in 1962. During the first four weeks of 1960 there was a total of approximately 2,900 excess deaths in comparison to a figure of approximately 1,600 excess deaths during the first four weeks of 1962.

Deaths 65 Years and Over Recarded in 108 United States Cities

4(D) Total Deaths, Persons 65 years and over..... 7,164

curred at a cub scout dinner in February. Of 240 individuals attending this dinner, 75 experienced nausea, abdominal pain, and diarrhea 6 to 8 hours after eating. Clostridium perfringens was cultured from a sample of the roast beef used at this meal. The other outbreak was a family outbreak with 9 of 17 people who ate the dinner becoming ill 8 to 9 hours after the meal. The illness was mild and consisted of diarrhea and abdominal pain of a few hours duration, associated with slight nausea. Clostridium perfringens was found in smoked ham and in homemade cheese used at this meal.

(Reported by James C. Hart, M.D., Director, Division of Preventable Diseases, State of Connecticut Department of Health.)

Editor's Note: The incubation period in these three epidemics, 6 to 14 hours, and the clinical symptomology, mild illness with diarrhea and abdominal pain in the absence of vomiting, form a rather consistent clinical picture.

INTERNATIONAL NOTES - QUARANTINE MEASURES

Smallpox - Europe

England - Five new cases of smallpox have been reported in England bringing to 21 the total number of cases in the recent outbreak. Seven deaths have occurred. Three tertiary cases have occurred in Bradford where 11 cases had previously been reported. The other two cases were reported from Woolwich, a suburb of London, where a 36 year old insurance agent became ill with smallpox on January 13, and from Horn Church, Essex, where an individual became ill on January 30. The Horn Church case has not yet been confirmed.

Germany - No additional cases have been reported following the initial reports of 4 cases with one death in Dusseldorf, Germany.

Immunization Information for International Travel

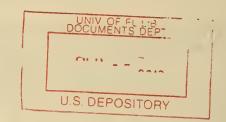

1961 edition - Public Health Service Publication No. 384 The following name should be added to the list of Yellow Fever Vaccination Centers in Section 6:

City	Center	Clinic Haurs	Fee
Ari zana	Pima Caunty Health	Friday, 3 p.m.	Yes
Tucsan	Department	by appaintment	
	161 W. Alameda Street		

Notes: These provisional data are based on weekly telegrams to the Communicable Disease Center by the individual State bealth departments.
